

ATM10 Space Server Player Setup

CurseForge install guide + whitelist request instructions

Use the exact versions: install ATM10 version 7.0 and use only the extra space mod files provided by the server admin.

1. Install ATM10 in CurseForge

- Install the CurseForge app from curseforge.com/download/app.
- Open CurseForge, choose Minecraft, and search for All the Mods 10 - ATM10.
- Install ATM10 version 7.0.
- Do not update the pack unless the server admin says the server was updated.

2. Add the Space Mods

- Download ATM10-Space-Mods.zip from the GitHub link below.
- Unzip ATM10-Space-Mods.zip.
- Open the ATM10 profile menu, choose Open Folder, then open mods.
- Copy the .jar files from the unzipped bundle into mods. Do not unzip the .jar files themselves.

Space mod bundle download

[Download ATM10-Space-Mods.zip](#)

Unzip it, then copy the .jar files into the ATM10 mods folder.

3. Memory Settings

- 16 GB computer RAM: allocate 8-10 GB.
- 32 GB+ computer RAM: allocate 10-12 GB.
- Do not allocate all your RAM; your operating system still needs room.

4. Join the Server

- Launch ATM10 from CurseForge.
- Choose Multiplayer.
- Add the server address from the admin.
- Join after your Minecraft Java username has been whitelisted.

Whitelist Request

Send the admin only this:

Minecraft Java username: YourNameHere

Do not send your Microsoft email, password, Discord name, or Xbox gamertag unless it is also your Java username.

Troubleshooting

- Not whitelisted: resend your exact Minecraft Java username.
- Mod mismatch: reinstall ATM10 7.0 and replace the extra jars with the admin-provided files.
- Startup crash: increase memory within the recommended range.
- Authentication failed: restart Minecraft and confirm your Microsoft account owns Java Edition.
